

Task 1 Report

Submitted by Haseeb Ijaz

1. What you learned from the lab ?

Answer:

- **Steer LLM** : Steer LLM during the iteration. Initial Prompt is one part. Steering the LLM is second.
- **Context Rot**: Use a new tab for new problems and don't pollute the context.
- **Rubric based Steering**: It is about Grading the output based on the given criterias.
- **Cross Model Verification**: Grade output from different models until it reaches 9 for all of them, Different Models can have different Blind Spots.
- **Show me the Code**: For Compute Problems like Totals, actual code running is required,
- **Step by Step Permission Framework**: Permission is earned step by step.
- **Safe Workflow**: You describe the task, ask for a plan, review and edit the plan and finally execute it.
- **One Prompt Applications**: Many small applications require a single prompt to be built and a few iterations can further improve them.
- **AI Assisted Diagram Creation**: Use Strong Reasoning model for developing SVG for better structure. Then use an image model to improve the design. AI is “**Jagged**”.
Structure First, Polish Second.
- **Exploring and not Expanding**: First just explore the ideas, based on the feedback generate new, and after selection expand the idea.

2. How has your prompting improved during the process ?

Answer: My prompting habits changed, I began using new tabs for new problems. I am beginning to use Show me the code approach for Compute Problems.

3. Which prompting techniques or approaches helped you the most ?

Answer:

- Using New tab to avoid Context Rot
- Asking AI Objectively
- Using Rubric and a Prompt to steer LLM to improve
- Show me the code
- Having Two Tabs open for 2 AI models

4. Challenges you faced and how you solved them

Answer:

I didnt face any challenge so far, everything was easily learnable and doable.
